

Лабораторная работа 3.

Логинов Сергей

Вариант 6

1. Подключимся к БД.

```
In [1]: import sqlite3

db_connection = sqlite3.connect('instacart.db')
db_cursor = db_connection.cursor()
```

1. При помощи запроса SELECT извлечем из таблицы order_products_train записи, соответствующие указанным в индивидуальном задании дню недели (1) и коду департамента (18). Определим количество записей в полученном наборе и определим количество товаров (поле order_id таблицы order_products_train) в транзакциях набора.

```
In [2]: query1 = "SELECT count(DISTINCT train.order_id) \
FROM order_products__train as train \
    join orders as o on train.order_id == o.order_id \
    join products p on train.product_id = p.product_id \
    join departments d on p.department_id = d.department_id \
where p.department_id = 18 and o.order_dow = 1"
query2 = "SELECT count(*) \
FROM order_products__train as train \
    join orders as o on train.order_id == o.order_id \
    join products p on train.product_id = p.product_id \
    join departments d on p.department_id = d.department_id \
where p.department_id = 18 and o.order_dow = 1"
count1 = db_cursor.execute(query1).fetchone()[0]
count2 = db_cursor.execute(query2).fetchone()[0]
print("Количество записей: {}\nКоличество товаров: {}".format(count2, count1))
```

Количество записей: 2186

Количество товаров: 944

1. Определим количество покупок для пяти наиболее популярных товаров за период, который дан в задании (1 день недели), с кодом департамента 18.

```
In [3]: query3 = "SELECT count(train.order_id) counter, p.product_name, p.product_id \
FROM order_products__train as train \
    join orders as o on train.order_id == o.order_id \
    join products p on train.product_id = p.product_id \
    join departments d on p.department_id = d.department_id \
where p.department_id = 18 and o.order_dow = 1 \
GROUP BY p.product_id \
ORDER BY count(train.order_id) DESC limit 5"
db_cursor.execute(query3)
print("5 наиболее популярных товаров:")
while True:
    r = db_cursor.fetchone()
    if r:
        print("Товар = {}(id={}); количество покупок = {}".format(r[1], r[2], r[0]))
```

```
else:
    break
```

5 наиболее популярных товаров:

Товар = Baby Food Stage 2 Blueberry Pear & Purple Carrot(id=43875); количество покупок = 45

Товар = Organic Mixed Berry Yogurt & Fruit Snack(id=21162); количество покупок = 38

Товар = Kids Sensible Foods Broccoli Littles(id=49215); количество покупок = 37

Товар = Gluten Free SpongeBob Spinach Littles(id=2611); количество покупок = 34

Товар = Broccoli & Apple Stage 2 Baby Food(id=3020); количество покупок = 32

1. Построим транзакционную базу данных для поиска ассоциативных правил из полученного набора записей таблицы `order_products__train`, используя в качестве идентификатора транзакции поле `order_id`, а в качестве названий товаров - поле `product_name` из таблицы `products`, соответствующее полю `product_id`. Заменяем пробелы в текстовых переменных на +.

```
In [4]: query4 = "SELECT o.order_id, p.product_name \
FROM order_products__train as train \
      join orders as o on train.order_id == o.order_id \
      join products p on train.product_id = p.product_id \
      join departments d on p.department_id = d.department_id \
where p.department_id = 18 and o.order_dow = 1 \
ORDER BY o.order_id"
db_cursor.execute(query4)

tdbase = []
I = []
j = 0
data = db_cursor.fetchone()
tdbase.append([data[0], {data[1]}])
while True:
    data = db_cursor.fetchone()
    if data:
        if data[1] not in I:
            I.append(data[1].replace(" ", "+"))
        if data[0] == tdbase[j][0]:
            tdbase[j][1].add(data[1].replace(" ", "+"))
        else:
            new_data = [data[0], {data[1].replace(" ", "+")}]
            tdbase.append(new_data)
            j += 1
    else:
        break
I.sort()
```

```
In [5]: tdbase
```

```
